

Laser Hair Removal

Laser hair removal is a medical procedure that uses an intense, pulsating beam of light to remove unwanted hair from virtually any part of your body, i.e., the face including the upper lip, underarm, bikini line, leg, arm, back and other areas. It is most effective for people with light skin and dark hair and typically requires multiple sessions for an extended hair-free period.

HOW IT WORKS:

The laser selectively targets dark hairs while leaving the surrounding skin unaffected. Each pulse of the laser takes a fraction of a second and treats multiple hairs. Small areas such as the upper lip can be treated in less than a minute; large areas like the back or legs may take up to an hour. Since hair grows in several phases and a laser only affects the active growing hair follicles, several sessions are needed to treat hair in all phases of growth.

TREATMENT CONSIDERATIONS:

- For 6 weeks prior, avoid plucking, waxing, and electrolysis. You may shave, which only removes hair above the skin. Avoid sun exposure for at least 2 weeks pre and post treatment. The area to be treated should be free of make-up, perfumes, lotions, creams, and/or antiperspirants. Tell us of medications you are taking or have taken over the past 6 months that increase sensitivity to light, i.e., antibiotic and antifungal medications and Accutane (isotretinoin).
- Just before the procedure, the hair to be treated will be trimmed to a few millimeters above the skin surface. The laser equipment will be adjusted for the color, thickness, and location of the hair and your skin color. You and the provider will wear appropriate eye protection. A test pulse to the treatment area is done and observed to confirm the settings before proceeding.
- Once treatment is completed, you will be given ice packs in the office to ease discomfort. Post treatment, aloe vera gel for cooling. A topical anesthetic cream such as lidocaine or a cooling lotion such as Biafine may also be prescribed.

WILL IT HURT?

With each pulse of light there is a stinging sensation as the hair heats up, described as a rubber band snapping your skin or like tweezing multiple hairs at once. The discomfort is proportional to the amount of hair in the area. There is a special cooling device built within the laser head that helps the laser light penetrate the skin and reduce discomfort. A cooling gel is applied to the skin before treatment and the tip of the laser is also chilled just before each light beam. Ice packs are used to cool the skin following treatment.

WHAT IS THE BENEFIT DURATION?

Laser hair removal reduces hair growth but does not guarantee permanent hair removal. Multiple treatments about 6 weeks apart will be needed for an extended hair-free period. The number of treatments depends on the size of the target area, skin tone and hair density. Periodic maintenance treatments may be needed as well. Maintenance sessions will become less and less frequent as time passes.
